The free float coefficient will be calculated as follows: 100% – (minus) shares as % of total excluded from the index. The free float corrected market value of a stock class will be calculated as follows: the price of the share x the number of shares x the free float coefficient. [Index description of HEXTech stock index]

When defining the amount of index shares, the calculations are based on the shares on Finnish securities accounts. Ownership information for foreign index constituents is not available; therefore the free float factor for these stocks is always 100%.

The weight-limited number of shares will be determined so that in the opening index on August 1, 2008 the total weight of the share series of any single company will be no more than 20 per cent. At the closing stock prices of July 24, 2008 this would mean that Nokia Oyj's number of shares in index would be ca. 72 million, TeliaSonera AB's number of shares in index would be ca. 274 million, and Elisa Oyj's number of shares in index would be ca. 94 million. The closing stock prices of July 24, 2008 indicate that no other weight-restrictions are required.
