YIT Corporation	YTY1V	127 223 422	84,557733%	

The free float coefficient will be calculated as follows: 100% – (minus) shares as % of total excluded from the index. The free float corrected market value of a stock class will be calculated as follows: the price of the share x the number of shares x the free float coefficient. [Index description of OMXH25 stock index]

When defining the amount of index shares, the calculations are based on the shares on Finnish securities accounts. Ownership information for foreign index constituents is not available, therefore the free float factor for these stocks is always 100%.

The weight-limited number of shares will be determined so that in the opening index on February 2, 2009 the total weight of the share series of any single company will be no more than 10 per cent. At the closing stock prices of January 22, 2009 this would mean that Nokia Oyj's number of shares in index would be ca. 437 million, Fortum Oyj's number of shares in

the index would be ca. 277 million and Sampo Plc A-shares in the index would be ca. 349 million. The closing stock prices of January 22, indicate that no other weight-restrictions are required.
