Vigmed has earlier been granted patent for the needle protecting solution CLiP<sup>®</sup>, and I.V. systems comprising CLiP<sup>®</sup>. This patent will broaden Vigmed's scope of protection, since it gives Vigmed protection for another feature of CLiP<sup>®</sup>, and regardless of field of application. An international patent application is also filed.

Vigmed has filed nationally and internationally more than 60 patents and patent applications based on three innovation platforms. The company owns all its patents and patent applications without any restrictions. The basic patents all have a maximum validity period.

Vigmeds strategy is to protect the Company's technology and products in all geographical areas deemed to be of importance. Vigmed intends to expand its patent portfolio continuously on both the offensive and defensive patent and utility model rights based on a number of new innovation platforms.
