Announcement no. 13/2007

To OMX the Nordic Exchange

Copenhagen, June 6, 2007

All patients are enrolled in Curalogic's clinical EU phase III trial with the ragweed product

Summary: *Curalogic has completed the enrolment of patients into the EU phase III clinical trial (RPE 04) with their product for treatment of ragweed allergy. A total of 545 patients have been enrolled into the trial. Patients will be treated until November 2007. Curalogic plans to report top line results from the trial in the first quarter of 2008.*

The market for Curalogic's ragweed product is large, as there are approximately 4 million people in Europe and 29 million people in the USA who suffer from ragweed allergy. Patients report ragweed allergy as being one of the worst pollen allergies

In 2007, Curalogic is conducting a clinical EU phase III trial (RPE 04) with the ragweed product. The enrolment of patients started March 11, 2007, and continued until June 4, 2007. Curalogic enrolled a total of 545 patients across USA, Italy, Hungary and Serbia. The ragweed pollen season starts in the middle of August, which means that all patients in the RPE 04 study will have a minimum of 10 weeks of treatment before the season.

Peter Moldt, CEO of Curalogic said: "It is a major milestone for Curalogic, that we have had a good start with the ragweed trial and that we have the necessary number of patients enrolled in our first phase III clinical trial. The start of a multinational phase III trial of this magnitude is a very challenging task, which the Curalogic team has managed in a competent manner. The achievement of this milestone is validating Curalogic's business model, where the activities are conducted through outsourcing to external collaborators, under the guidance of a small internal team of experienced drug developers."

Design of the clinical EU phase III trial

The RPE 04 trial is a randomized, double-blind, placebo-controlled trial. The purpose of the trial is to evaluate the efficacy and safety of daily doses of ragweed pollen extract administered orally to patients who are allergic to ragweed. Dr. Peter Creticos, Medical Director of the Johns Hopkins Asthma and Allergy Center, is the principal investigator in the RPE 04 trial.

Patients with moderate to severe ragweed allergy will be treated daily with an active dose or placebo. The active dose has in a previous trial, shown a similar reduction in allergy symptoms to the reduction that is achieved with injection immunotherapy. The patients will take the pill at home and are not required to be under medical supervision. Treatment has been started prior to the ragweed pollen season and will continue throughout the entire season. Curalogic is expecting to report top line results from the trial in the first quarter of 2008, and plans to submit an application for registration in Europe in the second half of 2008.

Yours sincerely,

Curalogic A/S

About Curalogic
Curalogic is a Danish biopharmaceutical company listed on the OMX Nordic Exchange (CUR.CO). Curalogic develops innovative pharmaceuticals for the treatment of allergy. By combining the best of two worlds - the efficacy of immunotherapy and with the safety and patient convenience of symptomatic treatments – Curalogic aims to develop a novel and user-friendly form of allergy treatment, and make it the preferred type of allergy treatment among patients. Curalogic has a broad and mature pipeline with a product for treatment of ragweed allergy in Phase III, a product for treatment of grass allergy ready for Phase III, a product for treatment of cat allergy in Phase II and a product for treatment of house dust mite allergy preparing for clinical trials.
