

Press release LightLab Sweden AB (publ) 2016-10-20

LightLab Sweden launches UV Boost™

This nanostructured coating by LightLab improves UV output of existing UV lamps, as well as sleeves and UV transparent protective windows by up to 15% at 254nm wavelength. The coating technology has been developed for cost efficient large scale manufacturing and can be added to existing production lines.

As earlier communicated LightLab is since 2015 developing technology to improve the light output, and thereby the energy efficiency, for light sources by so called light extraction technology. The technology has during 2016 been evaluated by several providers of UV lamps and is now launched to the whole market under the brand name UV Boost™.

Further information on UV Boost™ is now available at LightLab's website www.lightlab.com
